

What We Can't Do

Diagnose (other than minor ailments as seen in community pharmacy, or if a prescriber in a specific condition). Smears. Sick notes. Complex medical exams. Home visits are currently not being offered.

All practices in Sutton have a Clinical Pharmacist working in them. Please contact your surgery to book an appointment or review with one.

Who are Clinical Pharmacists?

Who are Clinical Pharmacists?

Clinical Pharmacists are experts in medicines. We provide face to face and telephone structured medication reviews, long term condition clinics such as asthma, type 2 diabetes and high blood pressure (hypertension). We also offer post hospital discharge reviews, and are on hand in the surgery to help with prescription queries and medication queries from patients and clinicians.

Some Clinical Pharmacists are also prescribers in a particular long term condition, which means we can support patients to manage their condition, and change medications/dosages as appropriate.

Qualifications

Clinical Pharmacists have completed a four year Master's degree in Pharmacy, followed by a pre-registration training year in either hospital or community pharmacy.

In order to work in GP practice, Clinical Pharmacists will be enrolled onto an 18-month NHS England approved training pathway, which is followed by a 6–9 month university based Independent prescribing course.

What We Can Do For Our Patients

- Managing repeat prescription requests
- Structured medication review (SMRs)
- Annual medication reviews
- Lifestyle advice
- Post hospital discharge medication reviews
- Medicine reconciliations of medication changes made upon hospital discharge or post hospital clinic
- Post hospital discharge medication reviews
- Long term condition clinics including asthma, diabetes, blood pressure and COPD
- Advising GPs/Nurses on safe prescribing
- Prescription or prescribing queries from patients/GPs/Nurses
- Signposting patients to other specialists or services
- Patient education
- Action MHRA drug safety alerts
- Telephone medication reviews for housebound patients
